Dylan Gray Didier

Orlando, FL | dgd0020@auburn.edu | (407) 493-0080

EDUCATION & HONORS

Auburn University | Samuel Ginn College of Engineering **Major GPA: 3.57/4.00**
Major: Computer Science Expected Graduation: May 2028
Artificial Intelligence Certification: Auburn University (Expected: May 2028)

PROFESSIONAL EXPERIENCE

HADDY | St. Petersburg, FL May 2026 – July 2026
Software Engineering Intern

- Built a Rhino/Grasshopper and Python pipeline that identifies and smooths unprintable overhangs in a scanned rock wall. Runs in **~6 sec** with **0** overhangs left, yielding a printable **5 ft × 3 ft** wall with **74** inserts
- Built a handheld defect logger (Raspberry Pi, Python, ToF sensors) that auto-calculates measurements and syncs to the cloud, tagging each photo with **16** defect types and **9** materials
- Developed a Node.js edge driver for factory status lights with O(1) lookups and **~10.6 ms** average API latency, plus a **3 s** timeout failover that prevents crashes
- Architected a Grafana and ClickHouse SQL pipeline that gives operators live machine states, refreshing every **5 sec across 3** states (running, maintenance, fault)
- Built an internal website from scratch (HTML, CSS, JavaScript) replacing scattered folders with one searchable platform of **20+** pages for factory training and hardware docs
- Built Google Chat integrations for the robot reporting system and Jira that post real-time robot status and project updates to team channels, improving visibility across engineering and production

ORCA Labs | Auburn, AL November 2026 – Present
Machine Learning Research Assistant

- Contributing towards building spatio-temporal action-anticipation algorithms optimized for real-time execution on Meta smart glasses hardware

PROJECTS

Personal Website June 2026

- Designed and deployed a responsive HTML, CSS, and JavaScript engineering portfolio globally on Cloudflare's edge network, with Git version control

Auburn–Regions Data Hackathon: Loan Default Prediction (3rd Place) October 2026

- Trained a LightGBM loan-default model in Python on **45,000** applications using 5-fold cross-validation and SHAP explanations, outperforming the team's logistic scorecard baseline (**AUC 0.746 vs. 0.742**)
- Prioritized the **10-input logistic regression** scorecard as the final model, giving up **0.004 AUC** for a points system that shows every declined applicant the specific reasons behind the decision
- Co-designed a profit-based lending policy that approves, declines, or offers a smaller loan by weighing expected profit against expected loss; our team's final strategy approved **69%** of applicants at a **6.2%** default rate

LEADERSHIP & ACTIVITIES

Sigma Pi Fraternity | Auburn, AL November 2026 – Present
President

- Lead a **180+** member chapter with a **$1M** annual budget, managing relations with the university and alumni network and overseeing day-to-day operations.

Head of Standards November 2025 – November 2026

- Enforced conduct and compliance policies for all members and reviewed events against university guidelines, reducing organizational risk and maintaining strong relationships with the university and external organizations

SKILLS & INTERESTS

Languages: Python, Java, C++, JavaScript (Node.js), SQL, HTML, CSS, Assembly
ML & Data: scikit-learn, LightGBM, SHAP, Pandas, NumPy, Matplotlib
Tools: Git, Grafana, Cloudflare, Raspberry Pi
Interests: Artificial Intelligence, Cryptocurrency, Snowboarding, High Diving, Tennis, Golf, Soccer, Football, Gym
